

Powder King,[®] LLC to Offer New Model Pulverizing Machine to the Rotational Molding Industry

ANTHEM, AZ • USA - Powder King, LLC announced that they have once again made a significant development in the pulverizing process. The unique direct drive “MEGA” pulverizing machine is the newest in the line of high production pulverizing systems manufactured by Powder King, LLC and partner King Machine & Tool at their 22,000 Sq. Ft. plant located in Massillon, Ohio.

For many years, the rotational molding industry has been stagnant in new equipment developments, until Powder King began to produce their unique models of pulverizing systems. “No other company has improved their products until Powder King launched our first systems, and the reality set in that a far superior pulverizing system was now available to the industry. We will never release a machine that doesn’t produce quoted rates,” stated Jim Hummel, president of Powder King. “We saw the need for advanced technology and improvements, reduced maintenance and higher production rates. We incorporated these requirements into all our systems, and now the ‘MEGA’ has been born with even higher throughputs and lower operating costs for molders. We

have increased proven outputs to over one metric ton per hour; this is very exciting and we are proud to offer these enhancements to our customers,” Hummel said.

The Powder King line of single mill and dual mill machines have also received a face lift on control systems. Powder King is now providing Eaton Culter Hammer electrical components, new larger 10” operator touch screen control, and offers inverter drives for mill motors to reduce the electrical demand to 1/20th of the normal electrical demand at start up to save our customers thousands of dollars in electrical demand cost. “I would say that the Powder King Pulverizing Systems now deliver everything that the industry has been looking for,” said Hummel.

Since 2003, Powder King has been supplying the latest in pulverizing technology and auxiliary equipment to

the rotomolding industry. The current demand for high quality machines with these new exciting advancements is very appealing. It is perfect timing to introduce a competitively priced new larger pulverizing system. “We are innovators and feel that we must listen to our customers. Constant development to always improve our products is in our best interest,” stated Hummel.

The pulverizing systems are offered with both a single and dual mill designs with outputs up to 3000 pounds per hour at various mesh sizes.
